**Vitamin D Management in Adults**

**NICE recommends that health professionals should NOT routinely test people’s vitamin D status** unless:
- They are considered to be at particular high risk or they show clinical features of deficiency - see [appendix 1](#)
- There is a clinical reason e.g. a metabolic factor (Specialists may test other specific patient groups if necessary)

Test before starting patients on an antiresorptive agent e.g. IV zoledronic acid or denosumab or oral osteoporosis therapy if not going to be co-prescribed vitamin D containing supplements.

---

**Initiate lifestyle interventions - see [appendix 2](#)**

**Measure 25OH vitamin D**

**Also arrange:**
- U+Es, LFTs, Bone profile, and PTH if calcium <2.15 mmol/L or >2.6mmol/L

---

**< 30 nmol/L**

**TREAT**

Treat only if one or more of following applies:
- Fragility fracture / osteoporosis / high fracture risk
- Drug treatment for bone disease
- Symptoms suggestive of vitamin D deficiency - [appendix 1](#)
- Increased risk of developing vitamin D deficiency e.g. Reduced UV exposure, raised PTH, treatment with anticonvulsants or glucocorticoids, malabsorption

If treatment not required reinforce lifestyle advice

---

**30-50 nmol/L**

---

**> 50 nmol/L**

**No treatment required**

Maintain vitamin D through safe sun exposure and diet / supplement use (OTC). More info in [appendix 2](#) and click [here](#) for patient leaflet.

---

**Does the patient have any of the following?**
- eGFR < 30 ml/min/1.73m^2
- Hypercalcaemia
- Granulomous conditions e.g. sarcoidosis, active TB

---

**YES**

Consider referral to appropriate speciality for advice

---

**NO**

**Does the patient have any of the following?**
- eGFR < 30 ml/min/1.73m^2
- Hypercalcaemia
- Granulomous conditions e.g. sarcoidosis, active TB

---

**YES**

Consider loading regimen

(Associated to 300,000 units colecalciferol orally over 6-10 weeks)

- See table 2 in [appendix 4](#)

**NO**

**Is the patient symptomatic or about to start zoledronate or denosumab?**

---

**YES**

Consider calcium and vitamin D orally (prescribe by brand name).

See [Notts Joint Formulary](#) for current preferred brands.

Add in Steroxel® D3 1000 units daily if Vitamin D was < 12nmol/L prior to treatment.

---

**NO**

**Routine replacement / maintenance therapy**

(for less urgent replacement and maintenance therapy)

Is calcium intake sufficient (≥ 700mg per day)? [Calcium calculator](#)

---

**YES**

Colecalficferol 800 – 2000 units oral daily (purchased OTC)

Prescribe only in exceptional cases if self-care not appropriate.

See [appendix 3](#) for detail.

Preferred brand:

Stexerol® D3 1000 unit tablets – one tablet daily

More options - see table 3 in [appendix 4](#).

**NO**

---

**Routine repeat vitamin D testing is not required, but reinforce concordance at routine reviews**

Following loading regimen, if still symptomatic at 3 months retest vitamin D and review diagnosis.

Patients with malabsorption conditions may require repeat testing. Review of on-going treatment will be dependent on the patient’s symptoms, risks and lifestyle

---

**Calcium normal**

Initiate maintenance therapy

**Hypercalcaemia**

Check PTH and refer to appropriate clinic

Clinical features of vitamin D deficiency and Osteomalacia

• Gradual onset and persistent bone pain without preceding mechanical injury (frequently in back, ribs or lower limbs)
• Fragility fracture
• Proximal muscle weakness (difficulty with stairs, getting up off the floor or standing after sitting in a low chair, waddling gait) or muscle pain
• Carpopedal spasm, tetany, seizures or irritability due to hypocalcaemia and requiring urgent treatment
• Osteopenia on plain radiograph
• Low bone density on dual energy x ray absorptiometry scan (does not equate to osteoporosis

Treatment of insufficiency and deficiency is advised in patients with the following:

• fragility fracture, documented osteoporosis or high fracture risk
• treatment with antiresorptive medication for bone disease
• symptoms suggestive of vitamin D deficiency
• increased risk of developing vitamin D deficiency in the future because of reduced exposure to sunlight, religious/cultural dress code, dark skin, etc.
• raised PTH
• medication with antiepileptic drugs or oral glucocorticoids
• conditions associated with malabsorption.
Appendix 2: Patient information about vitamin D and lifestyle advice

Link to printable local patient information leaflet:
Notts APC website / Patient Info / Vitamin D - Patient information leaflet

Lifestyle advice:

- From late March or early April to the end of September, most people should be able to get all the vitamin D they need from sunlight. The body creates vitamin D from direct sunlight on the skin when outdoors. Between October and early March we don't get enough vitamin D from sunlight and it is difficult to get the recommended daily intake from diet alone. Read more about vitamin D and sunlight on the NHS website.

- Public Health England suggest that people should consider taking a daily supplement containing 10 micrograms* (400 units) of vitamin D during autumn and winter when there is limited sun exposure. All year round supplements should be considered for people, who have very little or no sunshine exposure e.g. housebound, in a residential home, usually wear clothes that cover up most of the skin. Patients should be advised to purchase over the counter.

  *Note that supplements containing 25 micrograms (1000 units) are considerably cheaper to buy than those containing 10 micrograms (400 units) or 20 micrograms (800 units). This is a suitable dose to take as a daily supplement.

- Vitamin D is also found in a small number of foods including:
  - Egg yolks
  - Fortified foods – such as most fat spreads, soy yogurts, soy milk, almond milk, some orange juices and some breakfast cereals
  - Liver
  - Mushrooms (sunlight exposure increases vitamin D levels in mushrooms)
  - Oily fish – such as salmon, sardines, herring and mackerel*
  - Red meat
  - Ricotta Cheese

  *note that tuna (fresh or canned) does not count as oily fish (Eat Well, Fish & Shellfish NHS website)

- In the UK, cows' milk is generally not a good source of vitamin D because it isn't fortified, as it is in some other countries.

More information for patients is available on the following websites:

- NHS Website – Vitamin D
- National Osteoporosis Society: A balanced diet for bones
- Royal National Orthopaedic Hospital: FAQs about Vitamin D in childhood
- Royal College Obstetrics and Gynaecologists: Healthy eating and vitamin supplements in pregnancy
- BDA food fact sheet on Vitamin D
Appendix 3: Vitamin D products available without prescription

Patients should buy vitamin D supplements unless they meet one of the specific vitamin D exception criteria in the NHS England guideline: Conditions for which over the counter items should not routinely be prescribed in primary care (on pg. 17).

Note that maintenance or preventative treatment is not an exception for vitamin D. Exceptions to self-care are also listed in the local vitamin D position statements for Greater Nottingham and Mid Notts.

Prescriptions for vitamin D should be reserved for the treatment of patients with symptoms of deficiency or confirmed deficient vitamin D levels that require treatment with loading doses. Subsequent maintenance doses should then be purchased over the counter.

Patients can buy vitamin D supplements at most pharmacies and supermarkets for less than £3 for a three month supply. Women and children who qualify for the Healthy Start scheme can get free supplements containing the recommended amounts of vitamin D. The NHS website can provide additional information for patients.

Products available over the counter are suitable for replacement / maintenance doses as well as for prophylaxis in winter if required.

Pregnant and Breastfeeding women

NICE recommend that all pregnant and breastfeeding women should be informed about the importance of vitamin D and should take 10 micrograms (400 units) daily. Supplements are available to purchase over the counter or via the Healthy Start programme if the patient is eligible (see below).

High risk women (women with increased skin pigmentation, reduced exposure to sunlight, or those who are socially excluded or obese) may be advised to take at least 1000 units (25 micrograms) daily (in line with RCOG guidelines 2014).

REMEMBER – pregnant women should avoid taking multivitamins containing vitamin A (retinol) due to the teratogenic risk of vitamin A.

Healthy Start vitamins

Healthy Start vitamins (www.healthystart.nhs.uk) for women and children are free of charge for low income families and are available from Sure Start centres and some other health centres. You can also ask your midwife or health visitor for where they are available locally.

Women qualify for free Healthy Start vitamins from the tenth week of pregnancy or if they have a child under four years old, and if she or her family receives any of the following:

- Income Support
- Income-based Jobseeker’s Allowance
- Income-related Employment and Support Allowance
- Child Tax Credit (but only if the family’s annual income is £16,190 or less)
- Universal Credit (but only if the family earns £408 or less from employment)
- Working Tax Credit (but only if the family is receiving the 4 week ‘run-on’* payment)

*Working Tax Credit run-on is the payment received for a further 4 weeks immediately after ceasing to qualify for Working Tax Credit.

Women who are under 18 and pregnant also qualify, even if they do not get any of the above benefits or tax credits.

Some Sure Start centres will also sell them to other customers (at minimal charge), but not all have the facility to take money.

There are two different Health Start products:

- Healthy Start women’s vitamin tablets. The daily dose of one tablet contains: 400 units of vitamin D3 per tablet (as well as 70 micrograms of vitamin C and 400 micrograms of folic acid)
- Healthy Start children’s vitamin drops. The daily dose of five drops contains: 300 units of vitamin D3 (as well as 233 micrograms of vitamin A and 20 milligrams of vitamin C)

For those people in whom healthy start vitamins are not suitable, a range of vitamin D3 supplements are available for purchase over the counter.
Appendix 4: Recommended Vitamin D preparations for prescribing (when treating in accordance with Nottinghamshire vitamin D guideline)

It is recommended that only licensed vitamin products are prescribed.

**NOT RECOMMENDED:** Unlicensed ‘specials’ of vitamin D for adults in primary care should NOT be routinely prescribed.

Table 2 (updated Sept19): Recommended vitamin D preparations for loading regimen
*(To be taken with food) – all products listed are licensed in the UK*

*InVita D3® comes as a “Snap and squeeze” ampoule (see below). Patients should be advised to take InVita D3® at mealtimes – If preferred, the contents can be emptied onto a spoon and taken orally or mixed with a little cold or lukewarm food immediately before use. See SPC for further information.

**There is currently no licensed oral vitamin D preparation available that would be suitable for a vegan diet. There are unlicensed products available that may be suitable, please see the Specialist Pharmacist Service document “Which vitamin D preparations are suitable for a vegetarian or vegan diet?” for more information.

See table 3 overleaf for routine replacement therapy

Approved by Notts APC: November 2018 with minor update March 2019 to include vegan statement and Sept 2019 to review recommended brands. Review Date: November 2021
Table 3: Routine replacement / maintenance therapy
Products listed below are only to be prescribed if the patient meets the exception criteria listed in the local position statement. All other patients should be advised to purchase a vitamin D supplement which will provide 800 to 2000 units per day (click here for patient information leaflet).

* There is currently no licensed oral vitamin D preparation available that would be suitable for a vegan diet. There are unlicensed products available that may be suitable, please see the Specialist Pharmacist Service document “Which vitamin D preparations are suitable for a vegetarian or vegan diet?” for more information.

Intramuscular Injection:
Please note that injection of Ergocalciferol is not routinely encouraged due to variable absorption and slower onset of repletion. Therefore it should only be used if a patient cannot take an oral preparation.
Dose for osteomalacia treatment: 300,000 units of ergocalciferol given by intramuscular injection once only or give a second dose 3 months later
There is a licensed UK injection of ergocalciferol, but it is not always available. This is gelatin free. Ergocalciferol, 7.5 mg (300 000 Units)/mL in oil, Injection for intramuscular use only. 1-mL amp = £9.35.

Alfacalcidol/Calcitriol (Specialist initiation only)<br>Alfacalcidol and Calcitriol have no routine place in the management of primary vitamin D deficiency and should be reserved for use in renal disease, liver disease and primary hypoparathyroidism.
