

The prescribing of emollients should be reserved for the management of diagnosed dermatological conditions such as eczema or psoriasis, as per NHSE guidance.

SELF-CARE: Patients with mild dry skin, who do not have a diagnosed dermatological condition or risk to skin integrity, should be advised to purchase a suitable product over the counter (patient leaflet).

Mild dry skin can be successfully managed using OTC products on a long-term basis, and emollients on this formulary can also be bought from community pharmacies.

Please note that an exemption from prescription charges does not exclude a patient from the NHSE guidance.

Newly diagnosed patients – Offer the most cost-effective emollient from the formulary, depending on the severity of the condition, patient choice, and site of application.

Existing patients prescribed a least cost-effective emollient for a diagnosed skin condition — Review choice of emollient, with a view to trialling the most cost-effective emollient from the formulary.

Existing patients prescribed an emollient for dry skin with no dermatological condition or risk to their skin integrity by any healthcare professional – Review, stop prescribing, recommend OTC product for self-purchase.

#### Rationale:

Dry skin conditions lead to impaired skin barrier function and increase trans epidermal water loss. Emollients improve both of these factors and can help with scaling, and sensations of itching or skin tightness.

Choice is based largely on patient preference (e.g., greasiness, feel, smell & cosmetic acceptability), site of application, sensitivity to excipients and extent and severity of condition.

Patient compliance and education regarding appropriate application is key. All patients with dry skin conditions should be counselled on appropriate application technique. It is essential to find an emollient that is acceptable to the patient as this will enhance compliance.

### Consider the following when choosing an emollient:

- •History, type, and severity of skin condition as well as previous emollients and their effectiveness.
- Patient preference. Consider providing a selection of trial size packs to allow an informed decision about which product suits best.
- •Known allergens/irritation to skin products. Check ingredients (ointments have fewer potential allergens). Avoid using skin products which contain food allergens, particularly on skin that is inflamed and in infants before weaning.
- •Emollient requirements vary depending on severity of dryness, frequency of application and type of product used.
- •Cost: prescribed vs. purchased. Ensure the most cost-effective products are chosen.
- •Switching to first line emollients should be considered when reviewing therapy.
- •Follow up required (at least annually) to assess acceptability and effectiveness.

Туре	Comments
Ointments	Restore skin barrier most rapidly. Contain fewest preservatives so less likely to cause
(highest	skin reactions. Ideal under wet wraps and some can used as soap substitutes. Some
oil/paraffin	patients may find ointments less cosmetically acceptable. Advise night-time application.
content)	May exacerbate acne and folliculitis.
Creams with	Urea & glycerine have low molecular weight and water attracting properties and as they
humectants	penetrate the epidermis, they draw water from the dermis. Good for more severe dry
(urea/glycerine)	skin such as ichthyosis. May cause stinging.
Creams & gels	Less greasy consistency makes them cosmetically acceptable and suitable for daytime
(emulsions of oil	application. Absorbed quickly and well tolerated. Some can be used as soap substitutes.
& water)	May contain sensitisers.
Lotions (high	Absorbed quickly, spreads easily, however less effective as emollients. Useful for scalp
water content)	application. Minimal greasiness, no staining, less likely to cause folliculitis in patients
	with hairy skin. Can have alcohol base which can sting, can contain irritants. More
	frequent applications required.

# Suitable quantities to be prescribed for an ADULT for a minimum of twice daily application for ONE MONTH (half this amount for a child)

	Cream or Ointment	Lotion	
Face	60-120g	400ml	
Both hands	100-200g	800ml	
Scalp	200-400g	800ml	
Both arms/legs	400-800g	800ml	
Trunk	1600g	2000ml	
Groin & genitalia	60-100g	400ml	

### **Emollient application and use:**

- Each patient should have a personalised emollient plan.
- All emollients should be applied at least twice a day and more frequently if skin is extremely dry.
- •Apply routinely and continue to do so even when the skin is clear, to maintain skin integrity.
- •Apply gently in downward strokes in the direction of hair growth rubbing can exacerbate itch and thicker products applied upwards can lead to folliculitis.
- Ensure that emollients are fully absorbed into the skin if continence pads are used.
- •Avoid soaps, detergents, bubble-bath etc. which disrupt skin barrier. Hot showers can exacerbate itching.
- •Other topical preparations e.g., corticosteroids should be applied 30 minutes before or after emollients to prevent dilution or spread to unaffected skin.
- •Emollients in pots should be dispensed with clean spoons/spatulas to prevent cross contamination. Pump dispensers eliminate this risk and are suitable for patients with limited hand dexterity.

**Bath additives** should **NOT** be prescribed due to the lack of evidence of efficacy (guidance).

Most leave-on emollients can be applied before showering and then rinsed off. They generally don't foam but are effective at cleaning the skin. Or 1-2 tablespoons of any ointment (except 50:50) can be dissolved in hot water and added to bath water. Care required as emollients can make the skin and surfaces slippery.

Risk of severe and fatal burns with ALL emollients: MHRA Drug Safety Update Aug 20.

Patients should be advised to thoroughly wash any surface, clothing and bedding coming into contact with emollients. Even after washing residual emollient may remain.
